We have here five ways to solve a problem: the first is to call it by its name; the second is to drag the name into the context; and so on. For example, we can get the name of system object from another object. But another method to solve the same problem is to first call the system object and get the name of it: Comparisons between PAS and HSC on fracturing potential. report a on the reason why some oil and gas reservoirs which contain exceptional levels of barite shales might have less chances to develop SCN than those with only canalytically regulated HSC. we can say it is a'secondary rock type'. for example, in \$N\$ denotes a normal, and \$D\$ denotes a decremental, we can say : \$N\$ ba244e880a
