This article draws on quantitative data from the Canadian National Population Health Survey (NPHS) conducted in 1976. Health status is measured in terms of reported health and illness in the preceding four weeks. The major contributions to health are defined as any factor that is likely to prevent or slow down illness. Six factors are identified in the multivariate analysis and each is found to have a statistically significant effect on health for both sexes: age, income, health status, marital status, occupation, and health care utilization. The differences in the effect of the six variables found on the health of males and females is not statistically significant. Differences in the effect of age and marital status on the health of males and females are found to be statistically significant. It is concluded that these findings are consistent with the existence of a difference in the major contributions to health among males and females.Q. My photo-sharing site's images keep showing the image's source instead of the image I am a beginner in PHP. I am trying to build a photo-sharing website. My web hosting provider allows the use of cPanel, so I decided to use cPanel as well. I am using PHP and MySQL. I have a "new_photo" form. In that form, I have a submit button and two image input fields. After submitting that form, I am using cPanel's database storage function to store the picture in a MySQL table and making the user's name as the reference of the picture. The problem is that the MySQL database table contains the reference of the picture's source instead of the actual picture. This is how it's stored: image_name id source filename Then I take the filename in the table and I try to load the picture to display it in the website. \$newFileName = \$picName; \$newFileName = str_replace(" ", "-",\$newFileName); \$newFileName = str_replace
