Welcome to the AC Tropical Fish aquarium forum. Our aquarium forum is the place to discuss any aquarium related issue in a friendly environment. Our aquarium forum welcomes aquarists of all levels from beginners to experts. Please ask a question in the how to section of our forum or read the FAQ section if you have any questions. register to and become a part of our friendly aquarium forum community today.

the fish are stable now, but they are still swimming around all over the tank. how long do they need to settle down before i can put a cover on the tank? I would think no more than 24 hours. They should be cooped up for 24 hours after the ammonia level starts to drop (this is usually when ammonia starts rising again when fish are in a closed tank). If they have settled down by then, it is safe to put the lid on.

The present invention relates to a method for controlling a plant for separating solids from a liquid, as well as to a corresponding plant. Plants for separating solids from liquids have a long history. Such plants are, for example, used for the dewatering of sewage in wastewater treatment plants or for treatment of effluents of industrial processes. In the case of sewage treatment, a plant for separating solids from liquids is used for example to remove the sludge from the process water, and subsequently the water is discharged. The object of this process is to remove the sludge (combined with a certain amount of solids) from the process water so that the process water can be discharged. Conventional sewage treatment plants are largely based on the Bardenpho process. The Bardenpho process is described in detail in J. G. Bardenpho, *Die chirurgische Wartherapie der Aende*, *Zement- und Kalkindustrie* 9 (1929), No. 5, pp. 10-11. This process is a two-stage process in which the sludge is filtered off at the first stage of the Bardenpho process. In the second stage of the Bardenpho process, the filtered sludge is thermally sterilized and is discharged. The sludge that has not
