"MIDIGRAB is a simple command line tool designed to extract a midi song from uncompressed archives. This program is useful for a wide range of uses. Some people simply use it to extract midi songs from archives and move them to other formats (WAV, CDDA, MDA, mp3). Others use it to recover midi songs that have become corrupted. Others still use it to find the pitch of a song which contains mostly sharp notes. The most popular use of this program is simply to locate midi files in archives. This can be useful when a song contains many midi files. This program will open and read archives containing multiple midi files. This can be extremely handy, as many archive formats only read the first file from a file archive, and skip everything that follows. MIDIGRAB was written by Claude Montfort. One of the reasons that MIDIGRAB was written, was to find midi in archives that had become corrupted. This was due to archive programs not reading the header information when they read the files. The way MIDIGRAB works is that it first reads all files in the archive. It then determines the number of midi files, and read the header information. Next it proceeds to create all midi files. MIDIGRAB keeps track of the midi file creation order, so that if a midi file must be removed, it will not be removed last in the list. Though MIDIGRAB was designed to be used with midi archives, it has no limitation to that. It can read many other types of archives, so long as they are supported by some of the standard unix commands. This includes WAV, MP3 and BMP files. Though it does not look like it, it does open mp3 files. However, it will only read the first few mp3 files. It will not read files which contain more than one mp3 stream, even if you use the extended DOS format. MIDIGRAB can also open midi files. This is done by using the SND command, and using the second argument as a midi file. Though MIDIGRAB only reads the header information it does not convert it to midi files. MIDIGRAB is written in C. It requires a C compiler and
